

Product information

VAUNI ethanol fireplace GLOBE HIGH white

Art.Nr.: VNI02 / GTIN: 7340208300810 / manufacturer: [Vauni](#)

4.241,75 €

Regular retail price 4.465,00-€ (you save 223,25 €)

incl. 19% VAT incl. Shipping

 Delivery time: 4 - 5 weeks

Product information

Dimensions / Technical data:

Approx. dimensions: Ø 60cm, height 90cm, depth 58cm

Combustion chamber: stainless steel with absorption function, capacity 2 liters

Heating value approx.: 2 KW - burning time approx. 5-6 hours, flame size adjustable via regulator

Body: Cast iron with black or white heat-resistant coating

Inner, round plate optional:

Cast iron black matt lacquered (standard)

Shaped concrete from MBJ-Design in Mystic Graphite

Shaped concrete from MBJ-Design in Mystic Sand

Properties of the inner, round concrete top:

High stain resistance

High scratch resistance

Maximum fire and heat resistance

High color resistance

High UV radiation resistance

Excellent frost and thaw resistance

Low water absorption

High abrasion resistance

Easy cleaning thanks to non-porous surface

Floor stand: Cast iron base with felt glides and drilled holes for floor fixing if required.

Product description

VAUNI Globe High - bioethanol fireplace with increased presence and uncompromising design

Product information

The Vauni Globe High in black or white takes the iconic globe design to a new level - literally. Thanks to the high base, the fire source rises to eye level and creates a particularly impressive spatial effect. The sculptural look, combined with flexible placement and intelligent technology, makes this freestanding bioethanol fireplace the stylish focal point of any interior - whether modern, minimalist or urban-elegant.

Sculptural globe design on a stable high base

The Globe remains true to its striking, spherical design - but in the high version, the fire becomes even more the center of attention. The raised position gives the fireplace an almost floating effect and opens up new possibilities for interior design. Available in classic matt black or pure white, Globe High goes with almost any color scheme. The base is fitted with floor protection so that the fireplace can be turned at any time - without leaving marks.

State-of-the-art burner technology for a clean fire experience

Inside the Globe High is an advanced bioethanol burner that burns without smoke, ash or soot. The flame can be regulated as desired - whether as a subtle play of light or an intense source of heat. No installation or chimney is required. The fireplace can be repositioned at any time to turn the opening in the desired direction. Particularly ingenious: The insert around the burner is optionally available in cast iron black or as an exclusive version in cast concrete from MBJ Design (Mystic Graphite or Mystic Sand).

Maximum safety meets easy handling

Vauni Globe High has been developed for demanding users who value safety, efficiency and ease of use. The burner is equipped with an absorption core and leakage protection - for a safe and reliable flame pattern. It can be operated intuitively using the control rod supplied. Like all Vauni fireplaces, Globe High is also made by hand in Sweden - each one is unique and meets the highest quality standards.

Whether for the living area, the loft or the stylish waiting area - Globe High stands for uncompromising design quality, state-of-the-art technology and sustainable warmth without the need for a flue.

- Raised bioethanol fireplace without flue or installation
- Exclusive globe design on a high base with floor protection
- Available in black or white - five signature colors available separately
- Innovative burner with absorption function and safety features
- Adjustable flame without smoke, soot or ash
- Can be used indoors - also suitable for protected outdoor areas
- Burner insert: Cast iron black or MBJ cast concrete (graphite/sand)
- Made by hand in Sweden - each piece is unique

Functionality

The traditional wood-burning fireplace - loved and warming at all times. Heating the house with a crackling fire is nothing new. The bioethanol fireplace - a novelty in this field - is considered in many places as an equal alternative to the wood fireplace. We think: He is even the better alternative, because he saves not only the purse, but also the environment. You could also say: an ethanol fireplace has numerous advantages.

Efficiency of the fireplace with bioethanol or wood: A big advantage of the ethanol fireplace is that the waste heat of the wood fire is omitted. Instead of disappearing largely through the chimney, the heat goes directly into the room where the fireplace is located, with an efficiency of 100%. A wood-burning fireplace, on the other hand, has an efficiency of only 70%. The Vauni ethanol fireplace achieves a maximum heat output of 2-3 kW. The heat is delivered directly and selectively, and can thus serve as a supplement to existing heating systems. In most cases, a Vauni produces just the right amount of heat for a cozy supplementary heating system. With ethanol fuel for the Vauni fireplace, the heating value is nearly four times that of wood. Thus, a Vauni ethanol

Product information

fireplace is significantly more energy efficient than a wood fireplace for the same amount of heat. Choosing an ethanol fireplace also avoids the climate pollution and air pollution that wood fires can cause not only to the surrounding area, but as far away as the Arctic.

Saving money and time: choosing the right fireplace can save even more money. If you choose an ethanol-fueled fireplace, you are only buying the fireplace and the fuel. On the other hand, if you invest in a wood-burning fireplace, a building permit for a chimney must first be obtained, then the fireplace and chimney must be purchased and installed and approved. In addition, there are the costs of sweeping and regular purchase of wood. The price of installing a wood-burning fireplace is almost 2.5 times the price of buying and simply putting up a Vauni fireplace. Plus, with an ethanol fireplace, you save time and space. There is no need to store wood, and the fire can be lit easily without the need for kindling cubes, newspaper or the like. The ethanol fireplace warms directly with high power!

Bioethanol - a natural product: Bioethanol is not only a cheaper fuel than wood for a cozy additional heating. Bioethanol is also a clean and renewable natural product. Heating with your Vauni fireplace is therefore climate and environmentally neutral. Our Vauni Ecoflame Premium and Vauni Ecoflame Supreme fuels are 100% environmentally friendly and renewable. The bioethanol is made from potatoes, grain, corn, cellulose and similar raw materials. The combustion process is completely clean. Only extremely small amounts of carbon dioxide and water vapor are formed during heating. In fact, not much more carbon dioxide is emitted than when you exhale. When you heat with a fuel from Vauni, you can be sure that the combustion will take place without soot, smoke or ash. That is why Vauni fireplaces and bioethanol burners do not require a chimney - an active choice for environmentally friendly heating. But also for a fireplace with high performance.

Ethanol - the fireplace with the best performance: the bottom line is that the cost of your cozy additional heating per season can be practically halved if an ethanol fireplace is used instead of a wood-burning fireplace. With a bioethanol fireplace from Vauni and bioethanol as fuel, you will heat your rooms in an innovative and environmentally friendly way. The ethanol fireplace - just as popular and warming as the wood fireplace, especially gentle on nature and your wallet.

TÜV standard

DIN 4734 applies to all fireplaces operated with liquid fuels. These are decorative devices that produce a flame using a liquid or gel-based ethanol fuel. The standard was developed by the working group "Decorative Fireplaces & Ethanol Fireplaces," which includes renowned German and international manufacturers, in collaboration with the HKI Industrial Association (House, Heating, and Kitchen Technology). The DIN specifies requirements for the design, operation, and labeling of ethanol fireplaces. Another aspect of standard 4734 concerns the instructions and in-house production control requirements. Some manufacturers, such as GlammFire and Vauni, already offer safe ethanol fireplaces and burners that comply with this standard.

about Vauni

Vauni is a Swedish manufacturer of high-quality ethanol fireplaces and burners with a sophisticated design. Vauni's head office is located in Gothenburg. The premium brand manufactures high-quality ethanol fireplaces and stainless steel combustion chambers with a sophisticated design. All Vauni products are designed, developed and produced in Sweden. They are made of Swedish steel in Småland and have a high product quality.

The stainless steel combustion chambers with absorption function bind the liquid ethanol and ensure unparalleled safety. Vauni's burner is unique in the way it absorbs fuel. Combustion is slow, as only the fuel vapors burn. This makes Vauni fireplaces suitable for

Product information

domestic use as well as for yachts and houseboats.

Vauni fireplaces run on bioethanol and generate heat in a modern and environmentally friendly way. This means that the combustion is completely clean and, like the air you breathe out, produces only small amounts of carbon dioxide and water vapor.

Bioethanol & tips

Bio-ethanol 96.6% in 1 liter bottles: Perfect for table fireplaces. As diverse as our tastes, ethanol fireplaces have become indispensable in many households. The 1 liter bottles are perfect for occasional users or first-time users who want to familiarize themselves with their ethanol fireplace or our liquid bioethanol fuel. **How long does 1 liter of bioethanol last?** How long your own bioethanol stove burns with one liter of biofuel depends on various factors. Both **Ambient temperature, weather conditions, flame size as well as draughts** influence the possible length of the burning time. One liter can last for up to two hours with a high flame setting. The filling quantity also plays an important role. The more bio-ethanol is poured in at once, the faster the total quantity burns down. Conversely, the fire lasts longer if smaller quantities are used. Two liters are sufficient for up to three hours, but a half liter can burn for up to one and a half hours under ideal conditions. In strong draughts, the burning time is shortened in the same way as with wood or coal. Complete combustion - no undesirable combustion effects such as smoke or unpleasant odors and no combustion residues such as soot or ash. The bioethanol fuel, which consists mainly of bioalcohol, burns almost completely without producing smoke or odors. The gas produced during combustion (the carbon dioxide and water vapor mixture also exhaled by humans) is completely harmless to humans. No additional ventilation is required for normal ventilation of the rooms. Depending on the room temperature and whether the windows are open or closed, the bio-alcohol should be allowed to cool down for approx. 10 - 20 minutes after operating a bio-fireplace or bio-fireplace. When refilling, make sure that no ethanol is poured next to the fireplace. If something does go wrong, the ethanol must be removed before lighting the fireplace, e.g. with absorbent kitchen paper. To further increase safety, it is advisable to wait a short time until the bioethanol residue has completely evaporated. Burning bio-alcohol with an open flame requires as regular an air supply as possible (efficient room ventilation). In residential units (with a smaller cubic volume), a slightly open window is sufficient. A bioalcohol fireplace does not require approval from the chimney sweep or any other legal regulations or structural changes. A bioalcohol fireplace can therefore be installed and operated in any room of the house or apartment, regardless of the domestic conditions.
